

Deliverables

- **Script:** `car_preprocess.py` implementing Steps 1–10 with clear print checkpoints for each preprocessing stage.
- **Cleaned Data:** `car_l3_clean_ready.csv` containing the fully cleaned, encoded, engineered, and scaled dataset ready for machine learning tasks.
- **Reflection:** `reflection.md` (not exceeding one page) explaining the rationale behind each major preprocessing decision, including the use of median and mode imputation, IQR capping for outlier treatment, and the feature engineering techniques applied.
- **Requirements File:** `requirements.txt` listing the exact versions of all Python packages used to ensure reproducibility of the preprocessing pipeline.
